IDE TIPS (AGAIN!)

- ▶ ctrl + left click
- ▶ Takes you to method/class/whatever definition
- ▶ Use it!!!

5 / 21

QUESTION THAT HAVE POPPED UP IN THE COURSE SO FAR

- ▶ Java annotations
- ▶ Supported since Java 5
- ▶ Some annotations are used by the compiler or the IDE (e.g. “@Override”, “@Deprecated”)
 - ▶ You can remove them and the compiled code will do exactly the same thing
- ▶ Runtime annotations
 - ▶ Change the behaviour of the code
 - ▶ e.g., create an annotation to retry
 - ▶ <http://aspects.jcabi.com/>

6 / 21

EXAMPLE

```
public class MyResource {  
    @RetryOnFailure  
    public String load(URL url) {  
        return url.openConnection().getContent();  
    }  
}
```

7 / 21

TESTING

- ▶ You don't have to unit test
- ▶ You have to have a software testing schedule
- ▶ Even if manual
- ▶ State what you will test and how
- ▶ Unit tests should help catch errors

8 / 21

MODEL-VIEW-CONTROLLER

- ▶ The default architecture
- ▶ You need to update the model!
- ▶ More on this later

9 / 21

SENSORS

- ▶ Control Engineering
- ▶ What are sensors for?

10 / 21

RUNNING ON THE DEVICE DIRECTLY (1)

- ▶ Sensors don't make much sense in the emulator
- ▶ But you can debug directly in your device

11 / 21

RUNNING ON THE DEVICE DIRECTLY (1)

1. Enable developer mode on the device (device specific)
2. Connect your device to your computer's USB port
3. Setup your computer
 - ▶ Install Drivers (if on windows)
 - ▶ Run adb server as root / check lsusb for device in linux
4. run "adb devices"
5. Use the IDE to launch your app for the device

12 / 21

ANDROID SENSOR CATEGORIES

- ▶ Motion sensors
- ▶ Environmental sensors
- ▶ Position sensors
- ▶ All sensors types defined in `android.hardware.Sensor`

http://developer.android.com/guide/topics/sensors/sensors__overview.html

13 / 21

MOTION SENSORS

- ▶ `TYPE_ACCELEROMETER`
- ▶ `TYPE_GYROSCOPE`
- ▶ `TYPE_ROTATION_VECTOR`
- ▶ `TYPE_GRAVITY`
- ▶ `TYPE_LINEAR_ACCELERATION`

14 / 21

ENVIRONMENTAL SENSORS

- ▶ `TYPE_AMBIENT_TEMPERATURE`
- ▶ `TYPE_LIGHT`
- ▶ `TYPE_MAGNETIC_FIELD`
- ▶ `TYPE_PRESSURE`
- ▶ `TYPE_RELATIVE_HUMIDITY`
- ▶ `TYPE_TEMPERATURE`

15 / 21

POSITION SENSORS

- ▶ `TYPE_ORIENTATION`
- ▶ `TYPE_PROXIMITY`

16 / 21

FINDING AVAILABLE SENSORS

```
// global
private SensorManager sensorManager;
private Sensor accelerometer;
....
onCreate() {
    ...
    // within method
    sensorManager = (SensorManager) getSystemService(Context.SENSOR_SERVICE);

    // Get all sensors
    List<Sensor> deviceSensors = mSensorManager.getSensorList(Sensor.TYPE_ALL);
    // Iterate over sensors, find sensors you like etc,

    // get the accelerometer
    accelerometer = mSensorManager.getDefaultSensor(Sensor.TYPE_ACCELEROMETER);
}
```

17 / 21

LISTENING TO SENSOR EVENTS

- Within an activity that implements *SensorEventListener*

```
@Override
public final void onSensorChanged(SensorEvent event) {
    float[] acceleration = event.values;
    // do something with this, same as getting any other event
}

@Override
protected void onResume() {
    super.onResume();
    sensorManager.registerListener(this, accelerometer, SensorManager.SENSOR_DELAY_NORMAL);
}

@Override
protected void onPause() {
    super.onPause();
    accelerometer.unregisterListener(this);
}
```

18 / 21

HANDLING MULTIPLE EVENT TYPES

- One could possibly do
 - “SensorEvent.sensor.getType() == Sensor.TYPE_ACCELEROMETER”
 - Use if/switch statements
- Or register multiple listeners
- Use-case specific
- Group similar events together

19 / 21

HOW/WHEN TO USE SENSORS

- Sensors drain battery
- Some sensors drain more than other (e.g. Gyroscope vs Accelerometer)
- Not all devices have all kinds of sensors
- Device does not have a type of sensor, **getDefaultSensor** returns null

20 / 21

DISCUSSION

- ▶ Android devices sensors
- ▶ They can be used easily
- ▶ Debug on a real device
- ▶ Questions?
