Introduction (Apps and the Android platform)

CE881: Mobile and Social Application Programming

Simon Lucas & Spyros Samothrakis

January 13, 2015

Course Structure

- 10 weeks
- Each week:
    - 2-hour lecture (including group discussion and software demos)
    - 2-hour lab: practice writing and debugging apps
- Assessment:
    - 2 assignments
        - App prototype (20%, wk 19)
        - Final app (70%, wk 25)
- 1 progress test (10%, wk 20)
    - Multi-choice test under exam conditions

Mobile and Social Application Programming

- Course focus: the software design and implementation of mobile applications
- Exciting platforms to develop on
- Many facilities:
  - Powerful processors, reasonable memory
  - Hi-Res touch-screen
  - Connected: Internet (3G, WiFi), Bluetooth, Telephony, SMS, Near Field?, 4G?
  - GPS, location services, maps
  - Access to multi media play and capture
  - Motion sensors

Wide Range of Apps (1)

- Games

    - Casual e.g., reaction games, card games, board games, Tetris, physics-based
    - Arcade e.g., Asteroids
    - 3D Console Style e.g. Grand Theft Auto
    - Social e.g. Quiz (though QuizUp not yet on Android)

- Social

    - Facebook, Twitter

Wide Range of Apps (2)

- Sports
  - e.g. trackers like Endomondo, MapMyRide
- Productivity
  - Email, note taking, shopping
- Information (flights, weather, traffic,. . .)
- Transactional (e.g. Shopping: Amazon, eBay)
- Health, Education

Why Android?

- Open platform
- Large market share:
    - Diverse range of devices (some beautiful!)
    - Extensive monetization possibilities
    - Play store and other markets
- Powerful mobile operating system
    - Worth studying in its own right
- Good support tools and easy deployment
- Main language: Java
    - Well known, great IDEs (Intellij, Eclipse), easy to learn and use
- For more on Market Share see:
    - http://www.theguardian.com/technology/2014/jan/09/market-share-smartphones-iphone-android-windows

There are alternatives to Java!

- This course is java-centric
- Not always the case, android development is done in other platforms as well
- From Python (Kivy) to Unity, there are alternatives to Java
- Java is however considered the default android language

Android App Development

- Take an idea through to implementation and publication
  - Idea -> Draft Requirements
  - Requirements may change opportunistically
  - Underlying logic / model
  - File or Network I/O
  - Sensors
  - GUI Design and event handling
    - Glue logic: ensuring all components talk to each properly
 - Testing, Debugging, Redesign, Testing, Debugging, …
  - Design of Launcher Icon

Note on Opportunistic Development

- For your assignment, and for App development in general I recommend taking an agile development approach
- Start with a rough spec, implement a prototype, then redesign as necessary
- Don't bother trying to get all the details fully specified before implementing anything

Example

- 5 x 5 grid
- Deck of letter cards shuffled before each game
- Place each letter in the grid to optimise total word score
- Once a letter is placed it cannot be moved
- Scores: 5 -> 10, 4 -> 7, 3 -> 3, 2 -> 1
- A longer word overrides sub-words
- The pack has 52 cards and a single joker (wildcard)
- More popular cards have more copies in the deck
    - E.g., 4 Es, 1 Q
- Let's PLAY!!!

Play?
Sample App - Griddle

- Interesting case study
- Simple but enjoyable game
- Illustrates:
  - Reading asset files
  - Saving and loading state
  - Custom Views
  - Event Handling
  - Visualising information
  - Designing card decks for satisfying game experience
Use a Good IDE (e.g., IntelliJ or Eclipse)

- Auto-generate and check project structure
- Refactoring support
    - Change method names
    - Move methods between classes
    - Pull methods up from classes to interfaces
- Auto-check lots of tedious errors
- Navigate from usage to definition and vice versa
- Auto-generate UML Class Diagrams
    - Useful for high-level view
    - And inclusion in reports
- Drag and Drop GUI Designer

Mining the play store

- Discussion Question
    - As an app developer, what useful market research data is freely available from the Play Store PRIOR to publishing an app?
- And a follow-up:
    - What data is available after publishing?

From Java to Android

- Suppose you are a competent or even expert Java programmer
  - What more knowledge / skills do you need to become and Android Developer?
- App lifecycles
- Android API (e.g. the GUI classes are completely different)
  - Fortunately the many standard Java packages are all included
- XML Descriptor Files
  - Can design GUI using layout editor (which constructs XML), XML editor (text view), or write directly in Java

Good Android apps need to be well engineered

- Some standard ways of doing things
- And some important restrictions you need to learn
    - Seemingly innocent actions such as updating a view with the wrong thread can cause an app to stop
- Architecture such as Model View Controller (MVC)
    - Encapsulation of state (good practice anyway, but essential for easy restoration after a restart)
    - Attention to lifecycle
    - Bundling data
    - Activities, Intents, Fragments
    - Highly modular

Learning and Discovery

- This is a taught project-style course
- Lectures and labs will cover a good deal of useful material
- BUT: the Android platform is extensive, we won't cover it all
- You will need to discover / research many aspects for yourself
- Ask me and each other
- StackOverflow, developer.android.com and other resources
- Just Googling for a problem often finds the solution

When things go wrong

- Use IDE to find static edit / compile time errors
- For Runtime errors learn to use the Logcat
- All System.out is directed there
- Use Tags to filter most relevant messages
- Learn to use debugger
    - DDMS (Dalvik Debug Monitor Server)
    - Find problems with running code
    - (Dalvik is the name for the Android Java Virtual Machine)
- Google for solutions to other problems (e.g. deployment errors)

Hello World

- This is just one possible first app
- The one that gets auto-created by Intellij or Eclipse when selecting a Blank Activity
- (each IDE may have minor differences in the default HelloWorld app)
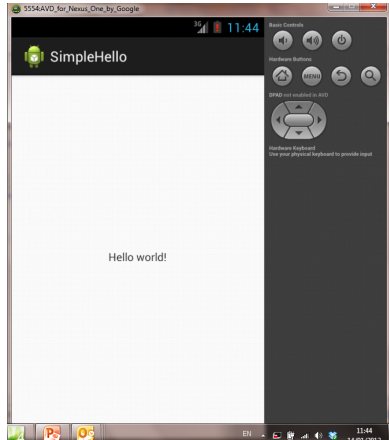

Hello World Code

```java
package com.example.simplehello;

import android.os.Bundle;

public class SimpleHelloActivity extends Activity {

    @Override
    protected void onCreate(Bundle savedInstanceState) {
        super.onCreate(savedInstanceState);
        setContentView(R.layout.activity_simple_hello);
    }
}
```

Notes on Hello World

- Extends Activity: this is the most common class to sub-class when making an app
- onCreate is the method called when the app is first launched
- Bundle is the set of data passed to onCreate that allows an App to re-create the previous state where the user left off
- Well behaved Apps normally do something to explicitly manage state
- Either using the Bundle, or by storing data in a file
- The file-based approach gives longer persistence

Anatomy of an Android App

http://developer.android.com/tools/projects/index.html

- assets: files you provide at compile-time for your app
- bin: the final .apk file for deployment on Google Play gets built here
- gen: auto-generated resources go here
  - generated from the XML files in the res folder
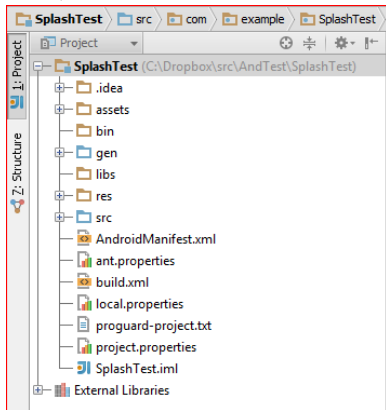

Anatomy Continued

- libs
    - Put library .jar files (e.g. we'll be using gson.jar to save and load data with minimal effort)

- res
    - XML files go here that specify GUI features of the project including the arrangement of component views

- src
    - Java files go here

- They should be properly package qualified
- e.g., for a developer account:
    - com.ssamotapps. . . . (important when publishing on Play)

Android Manifest File

| SplashScreen.java × | StartPage.html × | AndroidManifest.xml × | main.xml × | FirstScreen.java × | firstscreen.xml × |

```xml
<?xml version="1.0" encoding="utf-8"?>
<manifest xmlns:android="http://schemas.android.com/apk/res/android"
          package="com.example.SplashTest"
          android:versionCode="1"
          android:versionName="1.0">
    <uses-sdk android:minSdkVersion="17"/>
    <application android:label="@string/app_name" android:icon="@drawable/ic_launcher">
        <activity android:name="SplashScreen"
                  android:label="@string/app_name">
            <intent-filter>
                <action android:name="android.intent.action.MAIN"/>
                <category android:name="android.intent.category.LAUNCHER"/>
            </intent-filter>
        </activity>
        <activity android:name="FirstScreen"
                  android:label="@string/app_name">
        </activity>
    </application>
</manifest>
```

Important Aspects of the Manifest File

- The manifest file is auto-created by the IDE but may involve you specifying some options
- You can also edit these by hand
    - `<uses-sdk android:minSdkVersion="17"/>`
- Choose one as low as you can that supports all the features you need
- The application attributes specify the app name and the app icon
- Note the use of the '@' to refer to resources declared elsewhere:
- `<application android:label="@string/app_name"`
            `android:icon="@drawable/ic_launcher">`

The Res Folder

- Four drawable folders containing different resolution versions of the same icon
- A layout folder with an XML file for each activity
- A values file containing a strings.xml file to define commonly used string values
- Note: res folders can contain more than this

An application contains at least one Activity

- The one identified by the MAIN intent is the one called when the App is launched (e.g. by clicking the icon on a device screen)
- The main activity may then launch other activities
- Only one main activity can be defined per application
- But Activities may respond to other Intents

Exploring Manifest Entries

- Tip!
- Use navigation within an IDE to find where things are defined

```
<activity android:name="FirstScreen"
          android:label="@string/first_label">
</activity>
```

- E.g.
- In Intellij using -b will with the cursor in "FirstScreen" will take you to the FirstScreen.java file where the class FirstScreen is defined
- This also works for Strings and other definitions

Can you fully explain this line?

- setContentView(R.layout.activity_simple_hello);

Statistics

- Let's assume you finish the course
- What are your chances of earning money in the wild west?

Tools

TOOLS OF THE APP DEVELOPER TRADE

Tools let you do more with less, use them or be left behind
Summary

- Android is a rich and powerful platform, with many opportunities for developing and profiting from apps
- Give careful thought to the app you want to develop for this course
- IDEs such as Intellij and Eclipse take a lot of the tedium out of the development process
    - But Android is complex, and there is much to learn
- Massive audience, you still stand a chance to make it big

Recommended reading

- Note: much of the core material you need is freely available on-line
- But the book provides more insight and discussion in places
- Also many other books
- However: mostly it is best to learn by doing!
